NEMA® Cardiology Phantom
Nuclear Associates Model 07-680

Phantom and test procedures simulate a range of fluoroscopically-guided invasive and interventional procedures.

Provides simultaneous objective measurements of image quality and phantom entrance dose.

Test results characterize the performance of the complete system under simulated clinical conditions.

All tests are performed using the imaging system configured for normal clinical use.

Introduction
The NEMA Cardiology Phantom was designed by collaboration with SCA&I to provide a cardiovascular fluoroscopy benchmark phantom. It is used to test systems under conditions simulating normal clinical use for fluoroscopically-guided invasive and interventional procedures.

The phantom test ensemble includes: tests for imaging-field geometry, spatial resolution, low-contrast iodine detectability, working thickness range, motion unsharpness and phantom entrance dose.

Applications
Test objects are positioned at the center of the NEMA Cardiology Phantom. This simulates the location of clinically important organs. The NEMA Cardiology Phantom, positioned with its center at the x-ray system’s isocenter, simulates clinical imaging geometry. Therefore, the geometric magnification of the test objects is similar to that of the clinical target. The receptor blur, focal spot penumbra blur and x-ray scatter are also similar in test and clinical conditions. The entrance surface of a thick phantom is closer to the x-ray tube than the entrance surface of a thin phantom. This is an additional reason why patient (phantom) dose increases with phantom thickness.

- **Visualized field size** A plate is placed on the entrance surface of the image receptor. The plate is fluorographed to determine the actual field of view (FOV).

- **Congruence of irradiated and visualized fields** This test is not needed if the shutters are fully seen in the FOV under test. (CAUTION: digitally synthesized shutters may simulate this effect without actual beam collimation.)

- **Spatial resolution** A standard bar pattern insert is included in the central test plate. The test plate is placed with the bars at 45° to the video lines or digital image matrix. This produces the smallest change in the moiré pattern, resulting from a small change in angle. See Figures 2 and 3.

Features
- **Independent confirmation** Reassurance of an optimally working system
- **Quick evaluation** The machine is tested in its clinical configuration
- **Verification** That the system actually needs to be serviced, allowing you to save time, money and avoid more serious problems later on
- **Ease-of-use** Anyone with technical knowledge can do the tests to determine if corrective action is necessary
- **Peace of mind** To make sure that you are getting just what you paid for

![Figure 2. Spatial Resolution: the 1.4 & 1.6 line-pair/mm targets are resolved. The 1.8 & 2.0 targets are not resolved](image)

**Figure 2. Spatial Resolution: the 1.4 & 1.6 line-pair/mm targets are resolved. The 1.8 & 2.0 targets are not resolved**
• **Spatial resolution** *(continued)*

![Diagram of central test plate]

*Figure 3. Photograph and diagram of the central test plate. Note the resolution test plate, iodine contrast-detail targets, and working thickness range targets*

- **Low contrast detectability** Four sets of holes with diameters of 4, 3, 2, and 1 mm are filled with elemental iodine dispersed in epoxy. The relative areal concentration of iodine in the four patterns is 20, 10, 5, 2.5 mg/cm². The test operator is required to identify the smallest visible pair of targets in each pattern. See Figure 4.

![Working Thickness Range](#)

*Figure 4. Working Thickness Range. Three examples of white clipping and two examples of black clipping*

- **Visibility of moving structures** A rotating spoke target allows visual evaluation of motion unsharpness and the effects of temporal averaging. The device contains five steel wires of different diameters (0.022, 0.016, 0.012, 0.009 and 0.005 inches or 0.56, 0.41, 0.30, 0.23, 0.13 mm). Two lead dots are used to evaluate lag and recursive filtering. Rotation speed is 30 revolutions/min. The linear velocity of the outer lead dot is 200 mm/sec. The rotating disk replaces the central test plate at the isocenter. See Figure 5.

![Motion target](#)

*Figure 5. Motion target*

- **Dosimetry – dosimetry tools** The NEMA Cardiology Phantom entrance exposure rate is measured at a standardized position in front of the entrance surface of the phantom (25 mm). This position is considered an acceptable choice for this particular benchmarking phantom. The phantom can also be configured to generate the FDA measuring point (30 cm in front of the image receptor). See Figure 6.

![Example of typical dosimetry measurement](#)

*Figure 6. Example of typical dosimetry measurement. Dosimetry center is always 25 mm below bottom of phantom*

- **Working thickness range** The ability to image structures overlaid by bone or air. Systems with inadequate single-image latitude are unable to do this in bright (air) or dark (bone) portions of the image. The NEMA Cardiology Phantom contains eight cylinders composed of different heights of air, aluminum and plastic. These cylinders are calibrated for a total 20 cm phantom thickness. A 50 mm deep air challenge target overlaps the four air cylinders. The bright side dynamic range is determined by how many of these targets are seen. A 5 mm lead challenge target overlaps the four aluminum cylinders. The dark side dynamic range is determined by counting these targets. See Figure 4.
How does the NEMA Cardiology Phantom actually work?

The field size plate is placed on top of the phantom. A second plate with a centered radiopaque dot is placed in the base. The imaging gantry is adjusted until the cross wires intersect the approximate center of the disk. See Figure 7.

Fluorographs A and B demonstrate acceptable alignment of the NEMA phantom.

In fluorograph A, the spatial resolution test plate and several of the low contrast detectability targets are shown. Both lines cross at the dot.

Fluorograph B shows both lines crossing at the dot. (The test plates have been removed.)

Fluorographs C and D demonstrate poor alignment of the NEMA phantom.

In fluorograph C, the spatial resolution test plate and several of the low contrast detectability targets are also seen in this image. The intersection of the two lines is outside the dot.

Fluorograph D shows the intersection of the two lines outside the dot. (The test plates have been removed.)

For photographic purposes, only two of the test plates are shown; alignment is actually performed using required number of test plates.

ACR Radiography Fluoroscopy Accreditation Phantom
Model 07-903

Introduction
The ACR Radiography Fluoroscopy Accreditation Phantom is designed to be an integral part of the American College of Radiology (ACR) Radiography Fluoroscopy Accreditation Program. This voluntary program provides physicians with an opportunity for a comprehensive peer review of their Radiography Fluoroscopy facility, personnel qualifications, image quality and quality assurance programs.

Applications
The ACR Radiography Fluoroscopy Accreditation Phantom can be used for initial QA assessment and routine monthly QA testing to help ensure patients are receiving the best possible x-ray examinations. The phantom is manufactured from PMMA equivalent epoxy that offers the same x-ray attenuation properties as acrylic with significantly greater durability.

The overall phantom measures 25 wide x 25 long x 20.7 cm high and consists of three attenuation plates, one test object plate and a detachable stand for easy, reproducible set-up.

Test objects include high-resolution copper mesh targets from 12 to 80 lines per inch, two separate contrast-detail test objects.

Features
- Easy-to-use stand for easy use and reproducible images
- High resolution copper mesh targets and low contrast hole patterns help to quantify the full dynamic range of the systems capabilities

CDRH Fluoroscopic Phantom
Model 07-649

Introduction
The Nationwide Evaluation of X-Ray Trends (NEXT*) fluoroscopy protocol has been issued to provide guidelines for quality control procedures for diagnostic fluoroscopy. In order to perform these procedures, a suitable phantom was developed: the Model 07-649 CDRH Fluoroscopic Phantom.

In a survey of fluoroscopic facilities for the NEXT program, it was determined that a substantial proportion of facilities could not visualize low-contrast test objects; this strongly suggests image quality problems. Measurements for this survey were performed using the Model 07-649 CDRH Fluoroscopic Phantom. In addition to air kerma rate (free in air) measurements, imaging performance was assessed using the Fluoroscopic Image Quality Test Object (included with phantom). The phantom also contains a lead stop plate and copper attenuation plate.

Applications
By using the Model 07-649 CDRH Fluoroscopic Phantom, doses at fluoroscopy can be reduced, and fluoroscopic image quality can be improved.

Specifications
This patient-equivalent phantom of uniform thickness consists of a 7 inch thick acrylic block, one Fluoroscopic Image Quality Test Object, one lead stop plate and one copper attenuation plate. The base of the phantom is comprised of two type-1100 aluminum plates, each 2.3 mm thick. The phantom has four lead beads embedded on top, to be used as collimation orientation points. It stands on two legs, approximately 4 inches off the tabletop. One leg is specially designed as a probe holder.

Lead stop plate This 3.2 mm (0.125 inch) plate simulates maximum attenuation, and can be used to measure the maximum air kerma rate (free in air)

Copper attenuation plate This 1.6 mm (0.06 inch) copper filter simulates the presence of a 2 mm thick layer of barium sulfate, and can be used to measure the air kerma rate (free in air)

Fluoroscopic image quality test object

Dimensions 7 x 7 x 8 in (h) (17.8 x 17.8 x 19.3 cm)
Weight 21 lb (9.55 kg)
Optional accessories
Fluoroscopic Image Quality Test Object (Model 07-649-1169)
Carrying Case (Model 89-649)
Available model(s)
07-649 CDRH Fluoroscopic Phantom, includes fluoroscopic image quality test object, lead stop plate, and copper attenuation plate

Free clinical study reprint available

* The Conference of Radiation Control Program Directors (CRCPD), the professional organization of state and local radiation control agencies, along with the Food and Drug Administration (FDA) of the federal government, conducts the Nationwide Evaluation of X-Ray Trends (NEXT) survey program.
Fluoroscopic System Resolution Test Tools

Model 07-601

These 7.5 inch square plastic plates each have a 7 inch square area containing eight groups of copper or brass mesh screening in the following mesh-size ranges: 16 to 60 lines/inch, 30 to 100 lines/inch or 60 to 150 lines/inch. The screens are arranged in an irregular rotation to permit discrete visualization of groups. They can also be used to optimize television system focus as well as mirror optics and image intensifier settings.

Specifications

Dimensions: 7.5 (w) x 7.5 (d) x 0.35 in (t) (19 x 19 x 0.3 cm)
Weight: 0.5 lb (0.225 kg)
Available model(s):
- 07-601 Fluoroscopic Resolution Tool, 16-60 mesh
- 07-619 Fluoroscopic Resolution Tool, 30-100 mesh
- 07-618 Fluoroscopic Resolution Tool, 60-150 mesh
- 07-601-1414 Fluoroscopic Resolution Tool, 16-60 mesh, 14 x 14 inch

Fluoroscopic Beam Alignment Device

Model 07-600

In misaligned fluoroscopic image intensifier systems, the portion of the field that falls outside the visible area of the image receptor does not contribute to the useful fluoroscopic image and can result in unnecessary exposure to the patient. If corrective measures are required, this device will provide a measurement of optimum beam alignment. It consists of an aluminum plate with four sliding brass strips set in recessed channels. The strips define the visible area of the image receptor and are adjustable with respect to the center of the measurement plate. A transparent plastic overlay on the aluminum plate prevents the vertical displacement of the brass strips. Holes drilled at 0.5 inch intervals through the center of each channel are filled with high density plugs. The visibility of the plugs in the fluoroscopic image permits their use as a means of centering the device.

Specifications

Dimensions: 9 (w) x 9 (d) x 0.625 in (t) (23 x 23 x 1.6 cm)
Weight: 5 lb (2.27 kg)
Available model(s):
- 07-600 Fluoroscopic Beam Alignment Device
- 07-600-1414 Fluoroscopic Beam Alignment Device, 14 x 14 inch

Flex Film Cassettes Models 07-800 Series

We are pleased to offer Flex Film Cassettes, the flexible vinyl x-ray film holders that provide unsurpassed detail and resolution. Unlike conventional cassettes, Flex Film Cassettes contain no screen, so you get direct exposure of the x-ray film and a better image. Flex Film Cassettes offer an ideal combination of firmness and flexibility for a variety of medical and industrial applications; that’s why they are the most widely used flexible film cassettes in the industry.

Specifications

Weight: Less than 1 lb
Available model(s):
- 07-800-5007 Flex Film Cassette, 5 x 7 inch
- 07-800-1824 Flex Film Cassette, 18 x 24 cm
- 07-800-8010 Flex Film Cassette, 8 x 10 inch
- 07-800-8012 Flex Film Cassette, 8 x 12 inch
- 07-800-1012 Flex Film Cassette, 10 x 12 inch
- 07-800-1417 Flex Film Cassette, 14 x 17 inch

For additional information, please contact Cardinal Health, Radiation Management Services customer service at 440.248.9300, 800.850.4608, or fax: 440.349.2307; located at 6045 Cochran Road, Cleveland, Ohio 44139-3303, USA.

Digital Subtraction Angiography (DSA) Phantom*

Model 76-710

Introduction

This Model 76-710 Digital Subtraction Angiography (DSA) Phantom† conforms to the recommendation in Report #15 by the American Association of Physicists in Medicine (AAPM) - Digital Radiology/Fluorography Task Group of the Diagnostic X-Ray Imaging Committee.

Benefits

- Dramatic improvement in the quality of the subtracted image due to:
  - Improved phantom stability
  - Increased homogeneity of bone material in bone blocks
- Eliminates occurrence of mis-registration artifacts caused by inadvertent movement of the phantom components during image acquisition

Features

- Retaining hasps ensure a tight fit between the step blocks, for reduced motion artifacts
- Specially-designed “stop” on the end of the slot blocks improves the positional accuracy of the insert material during image acquisition, and reduces the number of DSA frames that must be acquired
- The U-block provides a very sturdy support when entrance exposures are being measured with a dosimeter ion chamber
- Two artery blocks in two concentrations of iodine: 15 mg/ml and 150 mg/ml, for increased clinical relevance
- A 300 mg/ml iodine artery block is available as an option

* Designed by Joel E. Gray, Ph.D., Professor Emeritus, Mayo Graduate School of Medicine and Jerome P. Taubel, R.T., Department of Diagnostic Radiology, Mayo Clinic® and Foundation. Manufactured under licensing agreement with Mayo Foundation for Medical Education and Research.

† This phantom conforms to the recommendation in Report #15 by the American Association of Physicists in Medicine (AAPM)-Digital Radiography/Fluoroscopy Task Group of the Diagnostic X-Ray Imaging Committee.

See also, RadiaXon™ Radiation Attenuation Gloves (Model 57-965) used in interventional procedures.
Specifications

- **Weight**: 30.7 lb (13.9 kg)

Optional accessories

- **300 mg/ml Stenosis/Aneurysm Artery Block**. (Not included with phantom) (Model 76-710-7300)
- **Digital Subtraction Angiography Phantom**, with Artery Block, 15 mg per ML venous concentration (Model 76-760)
- **Artery Block** (from 76-700 phantom), with 15 mg per ML venous concentration (Model 76-705)
- **Digital Subtraction Angiography Phantom**, with Artery Block, 150 mg per ML arterial concentration (Model 76-700-1150)
- **Artery Block** (from 76-700-1150 phantom), with 150 mg per ML arterial concentration (Model 76-705-1150)
- **Digital Subtraction Angiography Phantom**, with Artery Block, 300 mg per ML arterial concentration (Model 76-700-1300)
- **Artery Block** (from 76-700-1300 phantom), with 300 mg per ML arterial concentration (Model 76-705-1300)
- **Step Wedge** (Model 76-711)
- **Slot Block** (Model 76-712)
- **Bone Block** (Model 76-713)
- **Blank Insert** (Model 76-714)
- **Low-Contrast Artery Insert** (Model 76-715)
- **Low-Contrast Iodine Line Pair Insert** (Model 76-716)
- **High-Contrast Resolution Pattern Insert** (Model 76-717) (does not include test pattern(s))
- **Registration Plate** (Model 76-718)
- **Linearity Insert** (Model 76-719)

Optional high-contrast resolution test patterns

- **High-Precision Test Pattern**, 0.01 mm thick (Model 07-527)
- **High-Precision Test Pattern**, 0.10 mm thick (Model 07-538-1000)
- **Ultra-High Precision Test Pattern**, 0.10 mm thick (Model 07-538-2000)

(See Test Patterns data sheet for a complete listing)

### Available model(s)

**76-710 DSA Phantom**

Possible DSA phantom configurations

- Bone Block
- Slot Block for use with Slot Block Inserts
- Folded Step Block with Retaining Hasp
- U-Block to support phantom when using with dosimeter probe
- Unfolded Step Block with Retaining Hasp removed
- Registration Plate

CDRAD Contrast Detail Digital and Conventional Radiography Phantom
Model 07-652

Introduction
Most definitions of image quality in radiology are based on characterizing the physical properties of the image chain. However, medical diagnosis is not made by the image alone; observer perception greatly affects the result.

Digital radiography
The CDRAD Phantom from Nuclear Associates is an excellent tool for evaluating the imaging characteristics of digital radiographic systems, including stimulable phosphor computed radiography systems and teleradiography systems.

One of the principle concerns with the use of digital radiography, is the potential reduction in the visibility of detail due to the blurring introduced at various places within the system, such as the film digitizers, display monitors, and the sampling of the image into discrete pixels. Loss of detail is the image characteristic which can have an adverse affect on diagnosis. Resolution (bar phantom) test objects which are used to evaluate conventional x-ray imaging systems are generally not appropriate for evaluating digital systems. The CDRAD Phantom provides a reliable and objective evaluation of the loss of detail from blurring at any point within the system.

Image evaluation
- To evaluate the phantom image, the observer indicates the location of the second spot in each square. Correct indication proves that a contrast is actually seen.
- At the transition from visible to invisible, it is difficult to decide in which corner the second spot is located, and the response equals pure chance.
- The line connecting the central spots with the smallest visible diameter and contrast is called the Contrast Detail (CD) Curve.
- For comparison of the imaging performance of different systems, phantom images are made under identical conditions and evaluated by the same observer at the same time. The better system will produce an image in which smaller contrasts and details are visible. This results in a shift of the CD curve to the lower left part of the image.
- In the detail (vertical) direction, the diameter of the holes increases step-wise and logarithmically from 0.3 to 8.0 mm. The image shows 15 rows of spots with increasing detail.

Phantom specifications
- The CDRAD Phantom consists of a Plexiglas® tablet with cylindrical holes of exact diameter and depth (tolerances: 0.02 mm).
- The radiographic image of the phantom provides information about the imaging performance of the whole system.
- The image shows 225 squares: 15 rows and 15 columns.
- In each square, either one or two spots (the images of the holes) are present. The first three rows show only one spot, while the other rows have two identical spots; one in the middle and one in a randomly chosen corner. (See graph)
- The optical densities of the spots are higher than the uniform background.
- In the contrast (horizontal) direction, the depth of the holes increases logarithmically, and the image shows 15 columns of spots with increasing contrast.
- Comparison of the performance of several observers is also possible. The better performing observer produces a CD curve more to the lower left part of the image.

Specifications
Dimensions 10.4 x 10.4 x 0.3 in thick (26.4 x 26.4 x 0.76 cm)
Weight 3 lb (1.34 kg)

Quick and easily optimize images from your CR/DR system
- Effectively reduces equipment downtime
- Incorporates the “DIN” standard test pattern, DIN 6868/58
- Dramatically reduces repeat patient exams; thus preventing unnecessary patient exposure due to problems related to the image acquisition chain and poor image quality
- Lightweight; durable
- Easy-to-use; no moving parts
- Cost-effective

Features
Now you can quickly check all these important parameters:
- Dynamic Range
- Contrast Resolution
- Homogeneity
- Resolution

Specifications
Dimensions 14 (w) x 17 (d) x 0.5 in (t)
(35.5 x 43.1 x 1.5 cm)
Weight 7.05 lb (3.20 kg)
Available model(s)
07-605-7777 EZ CR/DR “DIN” Test Tool

Introduction
The EZ CR/DR “DIN” Test Tool is a timely and valuable solution to the image quality maintenance problem. Technologists, radiologists and physicists can easily perform quick and reliable assessments of their CR/DR systems.

Today’s new image acquisition chains are considerably more complex than conventional screen/film systems. Computed Radiography (CR)/Digital Radiography (DR) systems involve special processing for each body part. This is controlled by computers, rather than chemical processors and soft copy displays, which are calibrated using light meters rather than visual inspection. CR/DR systems also incorporate laser beams, photomultiplier tubes, network gateways and laser printers. The EZ CR/DR “DIN” Test Tool is designed specifically for evaluating the entire CR/DR image acquisition chain.

Applications
Ideal for use as a preventive maintenance quality control test tool, the EZ CR/DR “DIN” Test Tool can also be used to take regularly scheduled measured data points from the image, such as line pair resolution measurements, ROIs (regions of interest) and geometry symmetry. Measurements/angle can be used to evaluate monitor, as well as printed film image quality.

By performing daily quality control checks, both before the first patient is examined and at the end of the day, equipment problems can be accurately and easily pinpointed and corrected. Equipment downtime will also be significantly reduced, resulting in increased patient throughput. Patients will no longer need to endure repeat exams due to poor image quality.

You’ll soon realize a dramatic savings in film costs when you use our EZ CR/DR “DIN” Test Tool as part of your QC program. In addition, radiological personnel will experience significantly less of the problems and frustrations associated with equipment maintenance and thank you for it.
**R/F QC Phantom**
Model 07-647

Introduction
The R/F QC Phantom is designed to provide the diagnostic radiologic technologist with an accurate, easy-to-use tool for evaluating the image quality and performance of standard diagnostic radiographic and fluoroscopic imaging systems.

Applications
For fine-tuning of radiographic and fluoroscopic imaging systems, it is recommended that the phantom be imaged at least monthly on all radiographic and fluoroscopic equipment. To attain the most accurate, up-to-date quality control information, a daily or weekly frequency is preferable. When used daily, the R/F QC Phantom will allow the technologist to quickly determine whether the equipment is functioning correctly. This easy-to-use phantom allows the user to complete the suggested protocol in approximately 5 minutes or less, when used on a standard R/F system. Once the phantom is imaged, simply graph the results to determine any trends that may indicate a degradation of imaging system performance, such as a steady but slow change in the fluoro kVp or in the radiographic mAs.

Specifications
- **Dimensions**: 7 x 7 x 0.56 in (t) (17.78 x 17.78 x 1.42 cm)
- **Weight**: 1.1 lb (0.5 kg)
- **Available model(s)**
  - 07-647 R/F QC Phantom

For additional information, please contact Cardinal Health, Radiation Management Services customer service at 440.248.9300, 800.850.4608, or fax: 440.349.2307; located at 6045 Cochran Road, Cleveland, Ohio 44139-3303, USA.

07-647-ds rev 1 10 mar 03

- Designed specifically with the radiologic technologist in mind
- Provides an accurate overall evaluation of image quality consistency
- For QC of phototimer and automatic brightness control consistency
- Ideal for use in determining subtle degradation in imaging performance
- Fast, easy to use; average test time is less than 5 minutes per unit
- For use with radiography, fluoroscopy, and spot films, too
- Verifies fluoroscopic monitor contrast and brightness adjustment

**Features**
- At the center of the phantom are pie-shaped wedges of varying mesh sizes: 20#, 30#, 40#, 60#, 80#, and 100# L/in, for evaluating high-contrast performance
- Surrounding the mesh are four low contrast “masses” of different diameters: 2, 4, 6, and 8 mm
- At one edge of the phantom is a small “density difference” patch, for a measure of contrast on the films
- At the opposite edge of the phantom are two monitor adjustment squares, each having a low contrast square insert
- The phantom contains a 2 mm copper attenuator which allows it to simulate the attenuation of an average adult
- At the corners of the test tool are lines for aligning the light field
- QC charts are provided for plotting both the radiographic and fluoroscopic results
- Along the sides of the test tool are beads 1 cm inside and outside of the lines started in the corners
Contrast Imaging Phantom
Model 07-643

- Check dynamic range of the video system
- Check the system all at once
- Use it during all fluoro modes - pulsed, non-pulsed, etc.
- Check film range and density

Fluoroscopic Imaging Test Phantom
Model 07-653

Introduction

Ensure the optimum performance of your Fluoroscopic System with the Fluoroscopic Imaging Test Phantom.

This compact, versatile, and extremely easy-to-use phantom is innovatively designed to enable you to evaluate, adjust and optimize fluoro video cameras, brightness systems and image processing systems. Its proven design makes it ideal for use by x-ray service engineers.

Specifications

Dimensions
- Outside diameter 8.97 in (22.78 cm)
- Thickness 0.5 in (1.28 cm)
- Weight 4.10 lb (1.86 kg)

Available model(s)
- 07-653 Fluoroscopic Imaging Test Phantom

The Fluoroscopic Imaging Test Phantom provides a test pattern enabling the precise adjustment of many critical parameters of the Fluoroscopic System:

- Video level, contrast, peak whites, black level
- Shading or vignetting correction
- Automatic brightness
- Sweep linearity
- Frequency response, aperture correction

For additional information, please contact Cardinal Health, Radiation Management Services customer service at 440.248.9300, 800.850.4608, or fax: 440.349.2307; located at 6045 Cochran Road, Cleveland, Ohio 44139-3303, USA.

Diagnostic X-Ray Phantoms
Model 76-2 Series

- Phantoms conform to AAPM recommendations contained in Report #31, “Standardized Methods for Measuring Diagnostic X-Ray Exposure”
- Patient-equivalent acrylic and aluminum phantoms provide the necessary attenuation between the source and AEC or ABC detectors
- Helps you comply with JCAHO requirements for radiographic exposure measurements
- These phantoms are recommended in AAPM Report #60, “Instrumentation Requirements of Diagnostic Radiological Physicists”

JCAHO requires that x-ray exposure measurements be determined for commonly used projections in all radiographic suites. In order to provide this information when using Automatic Exposure Control (AEC) or Automatic Brightness Control (ABC) systems, specially designed phantoms must be used. Attenuating material must be used between the source and AEC or ABC detectors. Since these detectors are energy dependent, measurement of skin entrance exposure requires the use of patient-equivalent phantoms for meaningful results.

AAPM Report #31 recommends the use of four special phantoms for use in diagnostic x-rays. These acrylic and aluminum phantoms are patient-equivalent, and are specifically designed to conform to the AAPM recommendations.

Chest X-Ray Phantom
(Model 76-211)
The Chest Phantom consists of four sheets of 25 x 25 x 2.54 cm clear acrylic, one sheet of 25 cm x 25 cm x 1 mm and one sheet of 25 cm x 25 cm x 2 mm type-1100 high-purity aluminum, and spacers to provide a 5.08 cm air gap. Clinical testing of the phantom has shown it to be equivalent to a 23 cm patient for the PA chest projection.

Weight 17.5 lb (8 kg)

Abdomen/Lumbar Spine Phantom
(Model 76-212)
The Phantom consists of five sheets of 25 x 25 x 2.54 cm and one sheet of 25 x 25 x 5.08 cm clear acrylic to achieve a 17.78 cm thick phantom. In order to provide additional attenuation in the spinal region, a 7 cm x 25 cm x 4.5 mm thick piece of high-purity alloy aluminum is included.

Weight 37 lb (17 kg)

Extremity X-Ray Phantom
(Model 76-214)
The Extremity Phantom consists of one 25 x 25 x 2 cm piece of high-purity alloy aluminum sandwiched between two sheets of 25 x 25 x 2.54 cm clear acrylic.

Weight 10 lb (4.5 kg)

Skull X-Ray Phantom
(Model 76-213)
The Skull Phantom has the same configuration as the Chest Phantom, but without the air gap. It consists of four sheets of 25 x 25 x 2.54 cm clear acrylic, one sheet of 25 cm x 25 cm x 1 mm and one sheet of 25 cm x 25 cm x 2 mm high-purity alloy aluminum, and a center sheet of 25 x 25 x 5.08 cm clear acrylic.

Weight 26.5 lb (12 kg)

Make-Your-Own-Phantom Modular Kit
(Model 76-215)
This kit contains all the components needed to make any one of the phantoms on this page. It includes:

- Five sheets 25 x 25 x 2.54 cm thick acrylic
- One sheet 25 x 25 x 5.08 cm thick acrylic
- One sheet 25 cm x 25 cm x 1 mm thick aluminum
- One sheet 25 cm x 25 cm x 2 mm thick aluminum
- One sheet 7 cm x 25 cm x 4.5 mm thick aluminum
- Spacers for a 5.08 cm air gap

Weight 34 lb (15.3 kg)

For additional information, please contact Cardinal Health, Radiation Management Services customer service at 440.248.9300, 800.850.4608, or fax: 440.349.2307; located at 6045 Cochran Road, Cleveland, Ohio 44139-3303, USA.

CDRH Dental Image Quality Test Tool
Nuclear Associates Model 76-025

- Designed to meet the requirements for the NEXT* dental survey protocol
- Conforms to Center for Devices and Radiological Health (CDRH) specifications
- Provides a means of reproducible setup, ensuring a consistent test protocol
- Cost-effective; reduces the need for repeat films
- Reduces setup time
- Increases patient safety
- Minimizes chance of misdiagnosis
- Ideal for dental service engineers and inspectors

Introduction
The Nationwide Evaluation of X-Ray Trends (NEXT) dental protocol has been issued to provide guidelines for quality control procedures for diagnostic dental radiography. In order to perform these procedures, a suitable phantom was developed: the CDRH Dental Image Quality Test Tool (Model 76-025).

The JCAHO requires certain standards to be met regarding radiographic quality control. The CDRH Dental Image Quality Test Tool (Model 76-025) facilitates compliance with these standards, since the standards were compiled using a prototype of this phantom.

The CDRH Dental Image Quality Test Tool (Model 76-025) is designed specifically for testing the functionality of dental x-ray units, and provides a means of evaluating half value layer, determination of kVp, and assessing overall image quality. It is the only dental test tool designed with dental service personnel and inspectors in mind. The test tool will significantly improve the ability of service personnel to quickly and accurately survey the image quality of the x-ray unit. The CDRH Dental Image Quality Test Tool can also be used as a constancy check for x-ray film processing, making it the most versatile and cost-effective dental test tool available today.

Applications
Clinical imaging involves diagnosis of tooth pathology. In order to permit an accurate simulated clinical image evaluation, the test tool contains a human tooth encased in its center. The CDRH Dental Image Quality Test Tool (Model 76-025) consists of a wooden cradle (to hold the test tool body), built-in slots (for attenuation filters), a film slot, an exposure chamber holder, and a mounting screw (for use with a tripod). The test tool comes with an aluminum step wedge that is designed for evaluating darkroom fog and consistency testing. The step wedge has two slots, one for exposing a film pack and one for evaluating darkroom fog. The film slot also ensures easy, reproducible placement of the film for consistent imaging.

To use the CDRH Dental Image Quality Test Tool (Model 76-025), it is necessary to establish an acceptable baseline or standard for the x-ray unit performance. The test tool should be imaged using the same technical factors that were used to establish the baseline. These images, when compared to the baseline, will allow the user to determine if image quality degradation is occurring so appropriate corrective action can be taken.

* NEXT (Nationwide Evaluation of X-Ray Trends) is a committee of the Conference of Radiation Control Program Directors (CRCPD) that oversees quality control procedures for diagnostic radiology. They issue procedure protocols and guidelines for imaging modalities.
Specifications
The test tool includes:
- Four different copper wire meshes that have the following lines-per-inch ratios: 100, 120, 150, and 200
- Four air steps for contrast and density measurements
- One human tooth encased in the phantom material

Material: Wood base; acrylic test tool; type-1100 aluminum step wedge

Dimensions
- **Base**: 3.94 (w) x 7.87 (d) x 1.93 in (h) (10 x 20 x 4.9 cm)
- **Test tool**: 7.6 cm Ø x 5.5 cm long (3 x 2.17 cm)
- **Step wedge**: 5.1 (w) x 12.7 (d) x 1.3 cm (h)

Weight: 2.06 (0.88 kg)

Optional accessories
- **Aluminum Step Wedge** (Model 76-025-4000)

Available model(s)
- **76-025** CDRH Dental Image Quality Test Tool, includes aluminum step wedge
- **76-025-6661** Dental Image Quality Test Tool with Decayed Tooth, includes aluminum step wedge

Cardiac Digital Imaging/Cine-Video Quality Control Phantom and Patient Identifier*
Nuclear Associates Model 07-656

This patient-equivalent phantom provides permanent patient identification information (required by the ACC), as well as quality control checks for digital imaging (when exposed on the cine film or videotape at the beginning of the study, before the patient is placed on the table).

The phantom (all mounted in a single plate) consists of:
• High contrast resolution test pattern
• Four-step density contrast test section
• Mesh screen (20, 30, 40 mesh), to test for uniformity of focus
• Copper plate: 0.0937 inch thick

Specifications
Dimensions 8.50 x 8.50 x 0.375 thick (21.5 x 21.5 x 1.2 cm)
Weight 3 lb (1.3 kg)
Available model(s)
07-656 Cardiac Digital Imaging/Cine-Video QC Phantom and Patient Identifier

Ultra-High Purity HVL Attenuators
Model 07-434

- HVL attenuators recommended for mammography
- 99.9% pure for accurate HVL measurements

Because type-1100 aluminum is only 99.0% pure, it has some impurities that can give a HVL value which is 7.5% lower than those measured with pure aluminum.

When doing HVL measurements with a mammography unit, it is recommended that the highest purity aluminum be used. This set of six attenuators satisfies this recommendation, because they are 99.9% pure (type-1145).

Specifications
Dimensions 10 cm x 10 cm x 0.1 mm
Weight 0.15 lb (0.06 kg)
Available model(s)
07-434 Ultra-High Purity HVL Attenuators, set of 6
07-430 Standard Aluminum HVL Attenuators, set of 11
07-431 Copper HVL Attenuators, set of 10

* Designed by Joel E. Gray, Ph.D., Professor Emeritus, Department of Diagnostic Radiology, Mayo Clinic®, Rochester, MN 55905. Manufactured under licensing agreement with Mayo Foundation for Medical Education and Research.

**Image Intensifier Covers**

Models 03-003 to 03-604

- The Image Intensifier Covers are non-latex and protect both the patient and the equipment when performing a sterile procedure. They provide an excellent barrier and facilitates sterile handling of equipment. Each cover is individually packed in “peel open” pouches that provide high assurance of sterility.

**Ultrasound Probe Covers**

Models 03-416 to 03-748

- These non-latex covers protect both the patient and the equipment when performing a sterile ultrasound procedure. Probe covers are designed for one-time use only and are individually packaged in sterile pouches.

**Ultrasound Gel Products**

Models 03-361 to 03-924

- Ultrasonic gels are:
  - conductive
  - non-staining
  - non-corrosive
  - salt and alcohol free
  - odorless
  - water soluble

  Ultrasound scanning gels are specially formulated with the needs of the diagnostic imaging professional in mind. Our gel provides a superior transmission medium for high intensity sound waves. Our gel is also available in a therapeutic formulation for the therapeutic professional.
